

Netfabb Notes and General Information

Introduction

The scripts in this repository were written with the intention of making the quoting process easier. The goal is to quickly output a rough support and rough price estimation.

- **Input:** Client part files, either STEP or mesh (e.g stl)
- **Output:** Finished statistics CSV (containing build time, support volume, part volume, and outbox volume of the tray) and a folder with supported .3mf's of each part.

Notes about the project

Orientation and Support

The orientation and support addition are left to be done by the program, the employee, and the support scripts.

- There are heavy employee choices involved in this process.
- Automatic orientation is an extremely difficult task to program (see Help | PartOrienter | Autodesk).
- The part orienter in the Desktop Environment gives multiple options for ease of choice.

Custom Machine Configuration

For the custom machine, there is a file named `No_Build` that needs to be accessed via a file path every time a new machine is opened.

Resources

The most helpful place to search for functions and documentation is:

[Autodesk Netfabb Help](#)

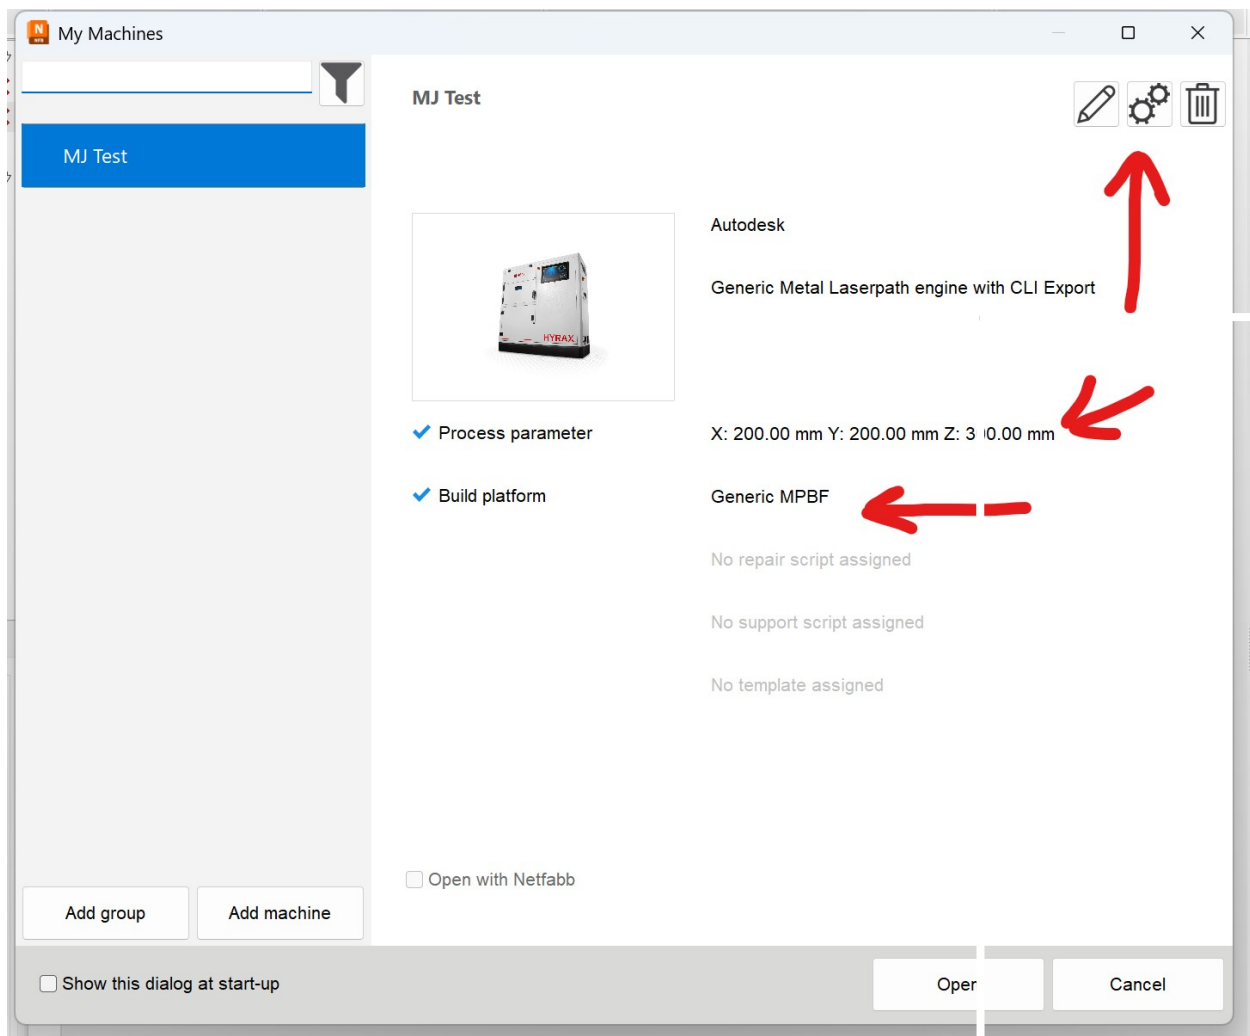

Time Estimates

Maarten and Fanie walked through the parameters that get the time estimates.

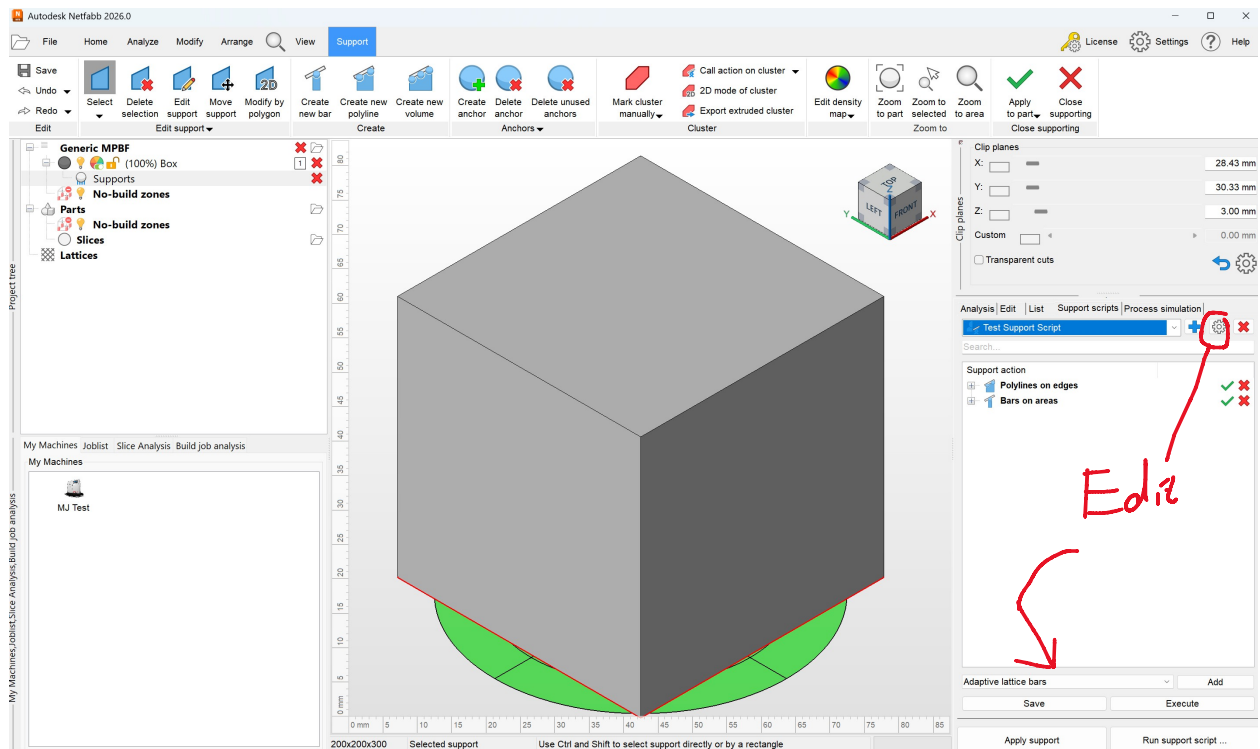

- There will be a PDF named "Time Estimate Review Unsurety Document.pdf" that contains the variables that they are unsure of.
